Screenshot 1: Cards rendered from events.json

The Upcoming Events section after fetch('events.json') succeeds. Each card is built from one JSON object, including the new free field (Free entry / Paid entry).

Screenshot 2: XML title shown on the page

The Data Formats section. The first title is read from events.xml with DOMParser and getElementsByTagName('title'); it also shows JSON dot/index values, the round-trip check and the byte sizes.

Screenshot 3: C1 validator error

events-broken.json contains one trailing comma. JSON.parse reports the exact error.

Screenshot 4: C1 one-character fix

After deleting the comma, the same checker reports valid JSON.
